Problem overview

SDK setup snippets are hand-maintained in `packages/sdk-info/src/snippets/` inside gonfalon.

<https://github.com/launchdarkly/sdk-meta/pull/396> merges the infrastructure that contains a canonical snippet format living in `sdk-meta`, a generator CLI that renders snippets into downstream consumers, and a Docker validator that runs each snippet verbatim against a real LD environment. The MVP covers `python-server-sdk` getting-started only. The work remaining is to expand coverage to all onboarding SDKs and wire the `ld-application` adapter into the app's SDK setup page so it becomes the consumer of record.

Docs pages also using `sdk-meta`

Solution overview

Utilize the snippets in the `sdk-meta` repo in gonfalon on the SDK setup page. We will utilize these snippets in our `sdk-info` package, onboarding flow and SDK keys page.

Solution details

Dependencies

Coordinate with the SDK team on metadata needed from `sdk-info` . Coordinate on snippets that are required before we rely solely on `sdk-meta`

Release plan

Ship behind guarded rollout

Next steps

Reviewer stance

Add your name + stance + main concern/question.

Reviewer	Stance	Main concerns/questions
	SUPPORT SUPPORT W/ CONCERNS CONCERNS NEED MORE INFO	
Natalie	Support	• Yes- this enables the SDK team to own/maintain the snippets, which is worthwhile
Lindsey	SUPPORT	• We've seen improvements to onboarding with the current SDK snippet improvements I think this just helps us go even further
Henry	SUPPORT	• What others have said 👍
